

Continue

Phones are crazy expensive right now if you insist on buying a company's latest and greatest. But if you're like me, you're just not going to spend \$1,000 of your hard-earned dollars on a phone when you know there are alternatives that offer almost as much for a good bit less cash. Thankfully, there are some great phones you can buy right around the \$400 - \$500 mark. The Pixel 3a is still a good buy, Apple's iPhone SE 2020 is super cheap for a new iPhone, and Samsung still sells 2019's sleeper hit, the Galaxy S10e. I've tried them all — not just picked them up and looked at them, but signed in with all my accounts and actually used them — and for my money, the Galaxy S10e is the clear choice if you want 90% of a flagship phone at 50% of the price. I just can't iOSSource: iMore (Image credit: Source: iMore)I'll let you in on a secret — I like the iPhone. I always have. Apple makes great hardware and when it comes to the basics of what a smartphone should be such as communications and entertainment, the iPhone nails it. Most of the time, those basics are exactly what I want from my phone. But then there are the other times: maybe I want to watch a video while checking messages or goofing around on Twitter. Maybe I'm "talking" to several people at once and need good notifications. Or maybe I want to open some app I hardly ever use and enjoy the tie-in to Google's huge library of online services. During those times, you love having an Android phone in your hands. It's icons. In a grid. With a folder named "junk" because you can't make them go away. Apple knows this, too, and iOS is slowly getting things like better notifications or widgets and has allowed Google to upload apps that help you connect your Google services together securely. That's a big deal and not any sort of admission of defeat by Apple — it's a case of giving customers the best features that they really want. The iPhone SE 2020 is a great phone, especially if you use a MacBook or an iPad or both. Apple has a gem with iMessage, and the hardware itself just feels good. But in 2020 I just can't deal with iOS. The best Galaxy S10Source: Andrew Martonik / Android Central (Image credit: Source: Andrew Martonik / Android Central)Samsung's Galaxy S10 line was a phenomenal success but it seems like everyone forgets about what I think was the best Galaxy S10e: the Galaxy S10e. With the S10e you get a phone that's a great size, has an incredible display, great cameras, amazing build quality, and all the features you expect from a Galaxy flagship plus a flat screen instead of that curved waterfall deal that a lot of people hate. It's really the only Galaxy S10 I was interested in having. It's not perfect. For starters, it's already a year old so that means you won't have the longevity of a 2020 model. When you compare that to the iPhone SE, which should get about five years of updates and support, that isn't something you can just dismiss. Ask yourself if you're going to really keep a cheap phone for five years. Spoiler: you're not. Except you probably can. If you're like a lot of people, myself included, you're never going to use a phone for more than a couple of years. Buying a phone with a zero-interest finance plan makes it too easy to upgrade, and when you're only spending half the amount of a flagship, the payments amount to what's basically pocket change each month. That makes it easy to not care about five years of updates, but I still can't ignore that Apple will give them to you, and Samsung won't. It's just not as big of a deal as it's made out to be for most of us. The cheapest iPhone has a more powerful processor than the most expensive Android phone. There's also the whole processor thing. The iPhone SE has a chip that's about twice as powerful in meaningful ways as the Galaxy S10e's Snapdragon 855 found in North American models. Having said that, you really won't see the difference during day to day use. The Galaxy S10e will do everything you ask it to do without bogging down or doing anything that makes you wish you had a chip that was twice as fast. The A13 Bionic futureproofs the iPhone SE in ways the Snapdragon 855 does not. This matters when it comes to future-proofing — one day there will be a game or an app that needs more horsepower than the S10e can deliver but that day isn't going to come very soon. You'll be using a different and newer phone by then anyway. Apple putting the A13 chip in the iPhone SE is astounding and important for Apple's supply chain, but overkill is overkill and either phone delivers the power you need to work, communicate, or just goof around with your phone. Android 10 seals the deal. When it comes to the hardware or camera or fingerprint sensor or any other physical thing about both the iPhone SE and the Galaxy S10e, you can't go wrong either way because both are great. I'd pick the iPhone simply because I like top and bottom bezels to hold the phone with my gnarly old fingers, but you might want to full-screen experience of the S10e. As I said, both are great. Sorry, but Android is just better. But the big difference, and what makes the Galaxy S10e my choice in the "cheap" phone lineup is Android. Android 10 brings some great privacy and security enhancements and it runs beautifully on the S10e's hardware. Plus Samsung adds some meaningful additions in areas like the camera app or HD Bluetooth codecs. I don't even use half of the features of Android on the S10e, but the ones I want and need the most make the phone a treat to use. I can tap my security key to the back of the phone to sign into my work email. I can talk in a big family group chat right from the notification. I can switch between personal and work Google services with a single tap. These are the sorts of things that make Android a much better choice for me, and why I think the Galaxy S10e is the best phone in this price range even though it's not brand new. You really can't say the Pixel 3a (or the 4a, which is coming so very soon) or iPhone SE or Galaxy S10e is a bad choice. But if I didn't have phones coming and going all the time because of my job, I know the S10e is the one I'd buy because I get to use them. If you're not completely entrenched in Apple's App Store or in iMessage, I think you would like the S10e better, too. Well, WWDC's opening keynote is behind us and, just as we suspected, the iPhone SE line didn't see a refresh. While this doesn't mean that the device is dead for sure, the industry's love for larger displays makes the SE's future much more ambiguous. Especially with today's tech being able to cram huge screens into relatively tiny bodies, we can't be 100% certain that we will see another incarnation of Apple's super-pocketable handset in the future. But then again, the iPhone SE was sort of designed for the slow upgraders — the people who don't mind sticking with older tech as long as it's small, easy to lug around, and fits the ton of accessories they've already bought for it. Such a target audience can definitely live with a 2-year upgrade cycle and, what's even more, they are not really prone to upgrade to an SE 2 as soon as it lands. Still, with the rumored drastic changes to the iPhone's design language, the form factor that was first introduced with the iPhone 5 may actually finally die. That doesn't mean the next SE can't still be some sort of super-small iPhone, does it? We thought we'd ask you whether you'd like to see such a compact device, here are the poll results! Apple has finally announced its much-talked-about low-cost iPhone 8 replacement. In the end, it turns out the name of the game is iPhone SE, though this is definitely not a replacement for the original iPhone SE and it's form-twin predecessors is color. Gone are the silvers, golds, space grays, and rose golds of yesteryear. Today's low-cost iPhone comes in black, white, and (PRODUCT)RED. Black is the kind of black you'd see on a Porsche and white looks like creamy marshmallow sauce, while (PRODUCT)RED looks like the perfect color nail polish for a night out. But if you were hoping for something a little more ... traditional, the iPhone 11 Pro lineup is closer to that tinted brushed aluminum look. If the traditional silver, gold, and space gray colors are most important to you, you may not want to upgrade to the iPhone SE (2020). If you were hoping for more colorful options, you should be looking at the iPhone 11 or iPhone XR. If price is more important than color, however, black, white, or red will do just fine. Touch ID vs. Face ID: Which one do you want? Multiple iPhones are stacked showing the Touch ID sensor. (Image credit: iMore)Some of our readers regularly express concerns over the usefulness of Face ID, and with everyone wearing face masks right now, I can see their point. If you still aren't ready to make the leap to facial recognition biometric security, you'll be in good company with the 2020 iPhone SE. It sticks with the familiar Touch ID and Home button that you may be more accustomed to. If you have always wanted to experience Face ID, upgrading to the iPhone SE is not for you. Instead, consider the iPhone XR for the least expensive of the current iPhone lineup. Is 5G your next phone? The iPhone SE does not come with 5G, so if you're holding out on your next iPhone purchase until Apple makes one with 5G support, you should keep saving your pennies until this fall (or possibly later). It's rumored that the iPhone 12 will come with 5G support. Remember, though, right now, the infrastructure for 5G isn't widely available. You'd pretty much have to live under a 5G tower in order to take advantage of its faster speeds. Is that important to you right now? Is Portrait mode for pets important? iPhone XS Portrait mode (Image credit: iMore)The 2020 iPhone SE gets a big camera boost over the iPhone 8, though it shares the same 12MP wide-angle lens camera, it supports Portrait mode, which is that awesome camera filter that computationally adds a bokeh background to photos. With Portrait lighting, you can turn your background into stark white, completely black, and a number of different sitting options. What hasn't been made very clear yet, however, and something I noticed in the fine print about Portrait mode on the iPhone SE is that it doesn't work with anything but human faces. It uses the same computational structure as the iPhone XR, which also only works on human faces. Though, Portrait mode on the iPhone SE (2020) is actually better than on the iPhone XR because it's built with the most recent image signal processor. What does that mean to you? If you were hoping to get cool looking Portrait mode shot of your pets, your shoes, or your food, you're going to be disappointed in Portrait mode on the 2020 iPhone SE. You may want to consider upgrading to the iPhone 11 instead. Are you on the iPhone Upgrade Program? If you're on the iPhone upgrade program from a couple of years ago, and your two-year stint is almost up, don't eye the iPhone SE as a possible upgrade replacement. The iPhone SE is not eligible for the iPhone Upgrade Program at this time. You'll be better off waiting until this fall when Apple (hopefully) launches the iPhone 12 (or whatever it will be called) iPhones (Image credit: iMore)What about Apple's other current iPhones like the iPhone XR, iPhone 11, or iPhone 11 Pro? That's a very good question. If we're speaking solely specs, the iPhone 11 wins the day, hands down. But, there are a lot more unanswered questions when it comes to other important things, like Touch ID vs. Face ID, camera lens options, and form factor. We've gone into much detail about this subject already. Should you upgrade from the original iPhone SE? If you're still sporting an original iPhone SE, then like me (I still have my rose gold SE in perfect condition), you're probably holding on to it for the size more than anything else. I get that. But, we're halfway through 2020 at this point, and Apple is going to continue iOS support for it for two more years, tops. I wouldn't be surprised if they preemptively ended support for the original SE after iOS 14, even though you'd normally get five iOS updates out of most iPhones. The original SE has such a small screen that the iOS interface has to be scaled down to fit. With every beta, I install it on my SE, just to see how it looks, and there is always a couple of screens that have overlapping text because downscaling didn't work for that view. It's time to let that old dog rest and move on to a new iPhone. I actually switched full-time to a new form factor with the iPhone X and have been very pleased with the size. It's got a narrow build, so even though it has a bigger screen than the iPhone 8 (and now 2020 iPhone SE), it fits in my hand much better. It's still a bit heavy, but we're never getting back the four-inch form factor, so we have to make some compromises. Should you upgrade from an iPhone 6s or 6s Plus? You most definitely should be considering an upgrade from your iPhone 6s. The biggest reason is that it's at its five-year mark. That means it's highly likely that iOS 14 will be the last operating system you'll be able to install on it. There are other reasons, as well. The iPhone 6s FaceTime camera is only 5MP compared to the iPhone SE (2020)'s 7MP camera. It only records video at 720p instead of 1080p. It doesn't have a water resistance rating at all, and if you drop it into the water, you'd better bet it's going to cause you problems. The processor chip, A9, is exponentially slower than the A13 in the iPhone SE (2020), which also attributes to better battery health. The iPhone 6s doesn't have a Neural Engine, which means Siri isn't capable of getting better at learning. Apple's Neural Engine improves the iPhone's ability to process words, images, and more. The iPhone 6s does still have 3D Touch, something Apple did away with in modern iPhones. Apple also, however, revamped what 3D Touch can do in iOS 13, which means it works more like current Haptic Touch features. So are you really losing much by giving up 3D Touch today? Should you upgrade from an iPhone 7? This is where we're starting to get closer, spec-by-spec, to the 2020 iPhone SE. It's also the last year that the rose gold iPhone was available. So if that pretty pink color is most important to you, you're stuck in 2016, at least until Apple brings back rose gold. The iPhone 7 has the same estimated battery life as the iPhone SE (2020), the same water resistance (IP67), the same 12MP wide-angle lens, the same optical image stabilization for video, same FaceTime HD camera, same video recording speeds. The list goes on. A better way to make the comparison is to note what the iPhone SE (2020) has that the iPhone 7 doesn't. The iPhone 7 runs on the A10 Fusion chip, which is powerful, but four years old and much slower than the A13 in the iPhone SE (2020). The iPhone SE supports Portrait mode and Portrait Lighting. It also has extended dynamic range for video and stereo recording. The iPhone 7 offers none of these features. Additionally, though the iPhone 7 will likely be supported for a couple more years, it is already four years old, which means you've only got about two more major operating system upgrades before the iPhone 7 loses upgrade support (except for security-related upgrades). Upgrading from an iPhone 7 to a 2020 iPhone SE is definitely a good idea, but not a must. Next year, however, your iPhone will be getting a little longer in the tooth. What about the iPhone 7 Plus? Well, there isn't currently an iPhone SE Plus, so if that large screen is important to you, I recommend holding out a little longer. There's a rumor that Apple is working on an iPhone SE Plus. Should you upgrade from an iPhone 8? Until the 2020 iPhone SE was launched, the iPhone 8 was still part of Apple's current lineup of phones. It's a fantastic phone with a solid processor, the A11 Bionic chip with Neural Engine. It's got a lot of the same features as the iPhone SE (2020) with a few notable differences. We actually wrote an entire article about their differences, an similarities and whether you should upgrade. The TL;DR is that, for the price, that faster processor and better camera make it a worthwhile upgrade. iPhone SE vs iPhone 8: What's the difference (and should you upgrade)? If you just bought an iPhone 8, though, don't feel like you've been left out. The iPhone 8 is still a fantastic iPhone. Should you upgrade from an iPhone X or XS? Similar to the iPhone XR, the iPhone X and iPhone XS have completely different form factors. They have Face ID instead of Touch ID and near bezel-less screens. The Display is actually larger than that of the 2020 iPhone SE, but they're also thinner (except for the iPhone XS Max, which has a behemoth 6.5-inch screen). The biggest feature bonus that the iPhone SE has over the X lineup is that it sports the A13 processor chip. If you bought an iPhone X or an iPhone XS, you probably bought it because you like the change in form factor, prefer Face ID to Touch ID, and want a bezel-less future. It's like comparing apples to oranges. Any questions? If I didn't answer all of your questions about whether you should upgrade, put them in the comments and I'll help you out.
